Maintenance and Service

9.0

Maintenance of Laboratory Furniture An annual maintenance of laboratory furniture is obligatory!

We optimize the smooth operation of your laboratory.

Laboratories are to be classified as safety installations.

Extraction devices and ventilation plants with air purification should to be maintained and their functions to be checked and recorded in regular intervals.

This inspection is to be carried out by a specialist.

The excellently trained service team has well-founded product knowledge in the areas of ventilation and filter technology, electricity/ electronics, mechanics and sanitary.

The WALDNER service stands for a privileged customer service directly from the manufacturer.

Inspection and maintenance

Our service technicians

- · record the various measuring results for supervisory bodies and laboratory users
- ensure for an optimal safety standard for your laboratory
- actively participate in decreasing your energy costs by adjustment of the air volumes

Maintenance as per range of performance

Air containment

- air containment measurements
- extract volume flow rate
- supply volume flow rate
- main volume flow rate
- visual air test
- flow tests in front of the appliance
- checking and, if applicable, cleaning the supply air system

Mechanics

- general visual inspection of the fume cupboard for outsi de damages
- checking of sash, cross slide, toothed belt / steel rope for damages, checking of track mechanism

Further checks are available on demand:

- electricity
- sanitary
- filter technology

Maintenance per objects

Fume cupboards

(supply air fume cupboard, extract air fume cupboard, fume scrubber, special purpose fume cupboard, filter fume cup board, radioisotope fume cupboard, mobile fume cupboard)

- with FAZ (function display)
- without FAZ (function display)
- with AC 2 (airflow controller)
- with AC 2 and SC (airflow controller and sash controller)
- with group controller

Safety cabinets

- solvents cabinet
- acid and alkaline cabinet
- · cylinder cabinet

Laminar flow workbenches

If available we would require the following information in order to prepare an offer for you:

- WALDNER number of delivery, or information of the foreign supplier (with or without control unit)
- · year of construction or date of commissioning
- information about the amount of objects to be maintained
- required range of performance of these maintenance works

AAS Extract Air Units

10.0

The AAS extract air units reliably and straightforwardly dispose of extract air. They have been developed according to the modular principle and thus combine the economic advantage of serial products with the practical requirements demanded for individual adaptation. Only a few standard elements are sufficient to do justice to all given situations on site.

No matter which modification you would like to have: This extract air system protects the laboratory personnel against health damaging residues of combustion.

The stability of the burner flame is ensured and the instrument is kept free from corrosive vapours.

The installation of this unit does not require a lot of work and may therefore be carried out at low costs - no matter whether with in-house fitters or by employing our installation service.

For disposal of extract air you may select from our range of offers.

Execution:

WALDNER domestic technique delivers you the system in stainless steel.

Arrangement:

Depending on the laboratory situation you may decide for a vertical (deflector hood) or for a horizontal (pipe) blow out. In both cases the fan and the blow out part may be arranged in a unit outside the laboratory, which results in a considerable muffing of noises.

Performance:

The required extraction performance depends on the type of flames used. For flames with low temperatures a flow rate from 180 to 300 m³/h is sufficient, whereas higher temperatures should be disposed with a capacity from 480 to 600 m³/h. The additional resistance from the length of lines then result in the selection of the fan.

Example:

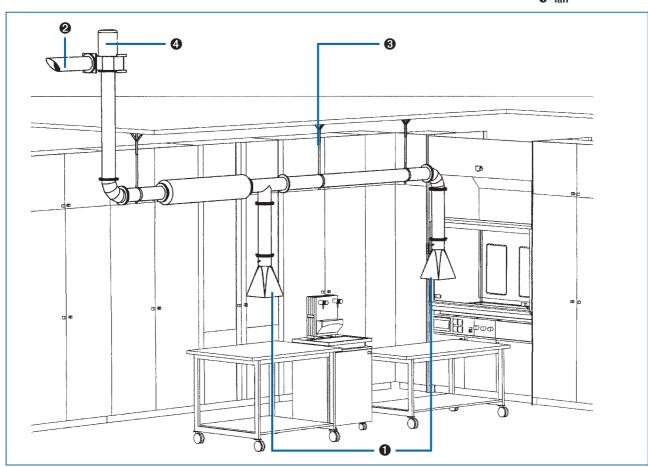

The equipment always comprises the following: extractor hood, telescope pipe, pipe systems, fan, blow out unit and fixation elements.

Distance between hood and burner:

May not be less than 200 mm. The fan ENG 6-13.13 is suitable for a length of line from 3 to 4 meter. In case of extreme working conditions we will plan your AAS extract air unit accordingly.

Illustration:
